

# AI Vocal Dataset Recording Brief

(คู่มือการบันทึกเสียงสำหรับนักร้องทำ AI Dataset)

## 1. Project Overview & Scope

- **Goal:** To collect highly clean, dry vocal stems to train a private AI voice model.
- **Scope of Work (2 Parts - Totaling 60-90 minutes of pure vocals):**
  - **Part 1 (New Recording based on Guide):** Record the 70-track scale and technique script ( Vocal\_Recording\_Score ). This captures your vocal range across registers and pure vowels (Approx. 15-30 minutes of singing).
  - **Part 2 (Provide Existing Vocals OR Record New Songs):** Provide raw, dry vocal stems for about **15 to 20 songs** (yielding another 45-60 minutes of pure singing). You can use your past recording sessions (Covers, Originals). **If you do not have enough clean, unprocessed stems, you may simply choose any songs and record new covers to meet the quota.** These will NEVER be published anywhere; they are used strictly internally to teach the AI natural word transitions.

## 2. License & Rights (ลิขสิทธิ์)

- **Commercial Buyout:** The recorded vocals will be used to train a private AI Voice Model (Vocal Clone). By accepting this gig, the singer grants full buyout and commercial rights for the vocal data to be used in AI training. The data will not be redistributed as raw stems.

## 3. Technical Requirements

- **Format:** .WAV format only.
- **Quality:** 44.1kHz or 48kHz, 24-bit, Mono channel.
- **100% DRY AUDIO: (CRITICAL FOR BOTH NEW RECORDINGS AND EXISTING STEMS!)** Do absolutely NO processing.
  - ❌ NO EQ
  - ❌ NO Compression
  - ❌ NO Reverb or Delay
  - ❌ NO Auto-Tune or Pitch Correction
  - 🛑 **DO NOT apply any compression, limiting, or de-essing during or after recording.**
- **Clean Recording:** Please ensure zero background noise, no air conditioning hum, and no plosives (mic bumps) or clipping.

## 4. Recording Guidelines (ข้อปฏิบัติในการร้อง)

To ensure the AI learns the voice correctly, please adhere to these rules:

1. **Mic Distance:** Maintain a consistent distance from the microphone throughout all recording sessions to keep the timbre stable.
2. **Consistency:** Sing with a consistent energy level and tone. Do not drastically change your vocal style between songs (unless specifically directed).
3. **Articulation:** Pronounce consonants and vowels slightly clearer than you normally would.
4. **Pitch & Rhythm:** Sing strictly on beat with the click track and accurately follow the pitch of the provided MIDI guide.
5. **Vocal Range Coverage (CRITICAL!):** The provided guide tracks/MIDI are just baseline starting keys. You **MUST** sing these scales while transposing them up and down to cover your **ENTIRE** vocal

range. Please allocate your recording time clearly as follows:

- **Chest Voice:** Approximately 20-30 minutes
  - **Mix Voice:** Approximately 20-30 minutes
  - **Head Voice / Falsetto:** Approximately 20-30 minutes This ensures the AI can synthesize high and low notes seamlessly across all registers.
6. **Syllable Continuity:** Please sing Legato (connected) and Staccato (short, detached) styles clearly and separately in each category. This helps the AI learn natural human-like transitions between words.
7. **Breathing is OK:** You can leave natural breaths in the recording! The AI learns from them. Just avoid harsh mic-bumping plosives.
8. **No Overlaps:** Only ONE main vocal line per track. Do not record harmonies or overlapping doubles in the same file.

## 5. Deliverables

- **1. Part 1 (New Recordings):** Render the continuous stems for the 70-track script.
  - *Sync:* All files must start exactly at 0:00.
- **2. Part 2 (Existing Stems for 15-20 Songs):** Provide the dry vocal stems.
  - *Note:* Please **provide the lyrics (text files) or the song titles** so our team can accurately transcribe the phonemes for AI training.

---

*Thank you for being a part of this project! If you have any questions, please ask before starting.*
